BB2165 Biomolecular Structure and Function HT22-1

<u>Course name:</u> Biomolecular structure and function	<u>Cycle:</u> 2
<u>Course code:</u> BB2165	<u>ECTS credits:</u> 7,5
<u>Term:</u> HT23	<u>Study period:</u> P1
<u>Course coordinator:</u> Christina Divne	<u>Examiner:</u> Christina Divne
<u>Number of new students 2023:</u> 100	<u>Students passed (all modules):</u> 93 (as of 2023-12-07)
<u>Degree of examination:</u> 95.3 % (as of 2023-12-07)	<u>Answer frequency LEQ:</u> 50%

About the course

The course is the first course in the two master tracks "Medical Biotechnology", and "Industrial and Environmental Biotechnology". Structural biology of biomolecules is a cornerstone in modern biotechnology. Students are offered theoretical and practical knowledge and insight about the foundations of biomolecular structure, and how the structure relates to function. The contents range from fundamentals in structural biology to contemporary research, and the precise topics are subjects of change to appropriately reflect the research frontier. Instructive computer-based exercises and a "real-life" project based on contemporary cutting-edge research offer a teaching concept that is highly interactive and practical to increase and deepen the perception and understanding of biomolecular structure-function relationships. The students acquire skills and tools to retrieve, use, understand, and validate structural biology information available in 3D structure databases. They acquire expertise about the interaction of biomacromolecules with ligands and how to predict the 3D structure of a protein with unknown experimental structure. The course has a high content of computer-based learning and makes extensive use of the Canvas learning platform. Importantly, the course uses continuous examination where knowledge and skills are practiced and examined throughout the course (Fig. 1).

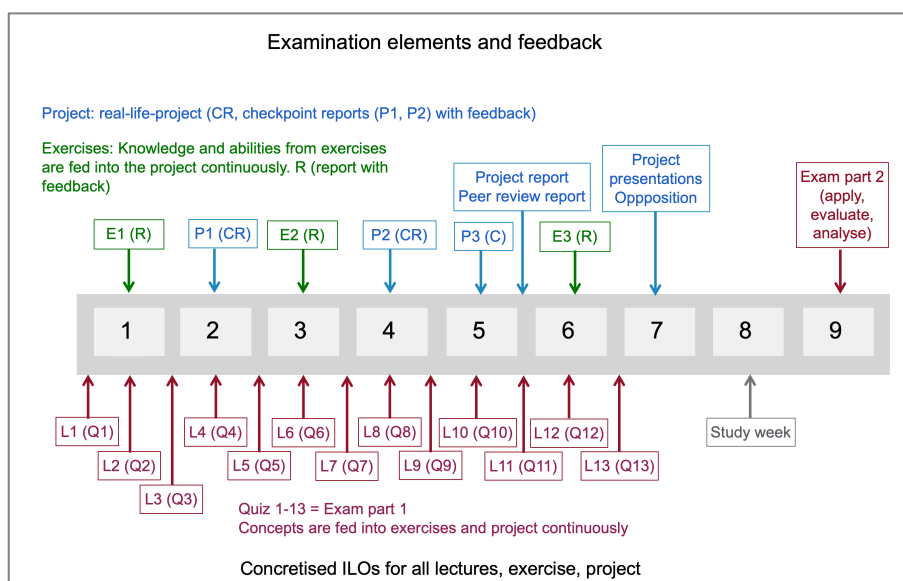

Figure 1. Scheme showing the process of continuous examination. The course weeks are numbered, and examination activities indicated by arrows. L=lectures, Q=lecture quiz, E=exercises, P=project, R=hand-in report. All examination activities have concretized intended learning outcomes that align constructively with the course's ILOs.

1. Changes made for the course offering 2023 (based on analysis 2022)

- The 2022 students were very satisfied with the course and only some improvements were needed for the course round 2023.
- The importance of knowing the properties of amino acids for the final exam is emphasized from the start. Students should know the letter codes (one-letter or three-letter) and the principal properties of the amino acids, but do not need to be able to draw them.
- Some students wanted extended support for the PyMOL as software. This year it was made optional to use PyMOL for the project and tutorials were provided in canvas.
- The students wanted more relevant examples for the final exam, which was provided 2023.
- The canvas now also included guidelines for working with AI tools (chatbots etc.)

Course analysis

2. Summary of LEQ statistics 2023

From LEQ and comments, the 2023 course round was greatly appreciated and well received (Fig. 2; all students). The answer frequency was high for being an online questionnaire (50%).

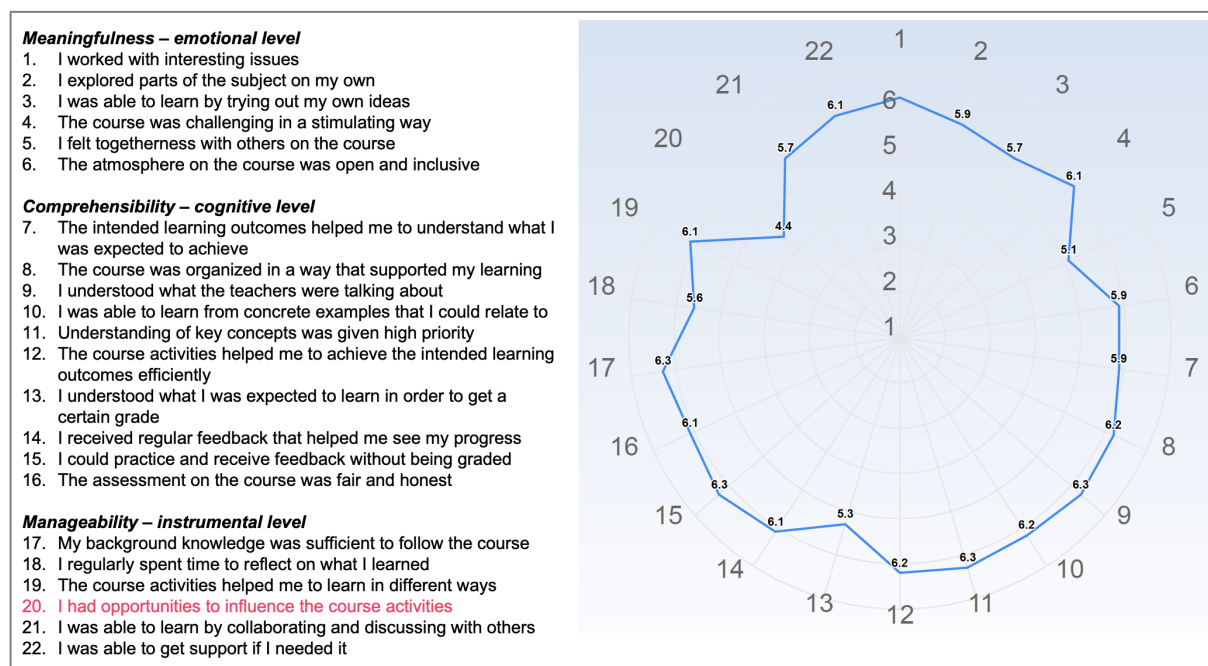

Figure 2. LEQ questions and spider diagram for 2023 (all students).

The reception of the course round 2023 is very similar to that recorded for 2022 and shows that the development actions implemented during the period 2021-2023 are reflecting a real and consistent improvement over time. All aspects (meaningfulness, comprehensibility, and manageability) score high, with the only exception being question 20 "I had opportunities to influence course activities", which scored 4.4 – this is however still above average. The result is expected considering that the course is structured in detail to enable all learning outcomes to be reached by the end of the course.

It is rewarding to see that the following questions **scored >6**, which is very high:

1. I worked with interesting issues
4. The course was challenging in a stimulating way
8. The course was organized in a way that supported my learning
9. I understood what the teachers were talking about
10. I was able to learn from concrete examples that I could relate to
11. Understanding of key concepts had high priority
12. The course activities helped me to achieve the intended learning outcomes efficiently
14. I received regular feedback that helped me to see my progress
15. I could practice and receive feedback without being graded
16. The assessment on the course was fair and honest
17. My background knowledge was sufficient to follow the course
19. The course activities enabled me to learn in different ways
22. I was able to get support if I needed it

Additionally, the following questions **scored 5-6**, which is also very good:

2. I explored parts of the subject on my own
3. I was able to learn by trying out my own ideas
5. I felt togetherness with others on the course
6. The atmosphere on the course was open and inclusive
7. The intended learning outcomes helped me to understand what I was expected to achieve
13. I understood what I was expected to learn in order to obtain a certain grade
18. I regularly spent time to reflect on what I learned
21. I was able to learn by collaborating and discussing with others

As mentioned above, the only question that scored below 5 was no. 20:

20. I had opportunities to influence the course activities (4.4)

Course analysis

Since the course has a diverse student composition with program master students and international master students it is interesting to deconvolute the statistics based on this diversity, as well as based on disability to monitor that all students receive equal conditions, opportunities, and support. Based on the deconvolution of national/international students (Fig. 3), it is particularly interesting, and positive, to see that the international students scored 7 on interest in the course topic, and very high on how the amount of support they received, that the course was challenging in a stimulating way and several other aspects (highlighted in green).

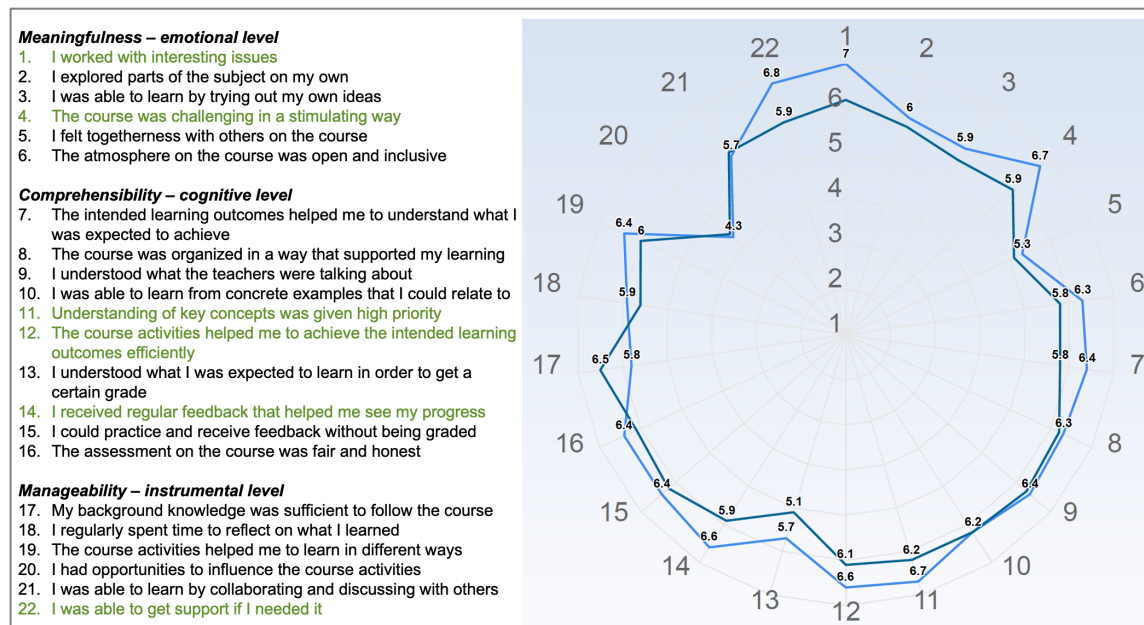

Figure 3. LEQ spiders for 2023 national (dark blue) and international (light blue) students. Questions that score particularly high are highlighted in green.

Inspecting the LEQ result based on disability (Fig. 4), a similar positive result (and even slightly more positive) is noted for students with disabilities compared with the result for all students.

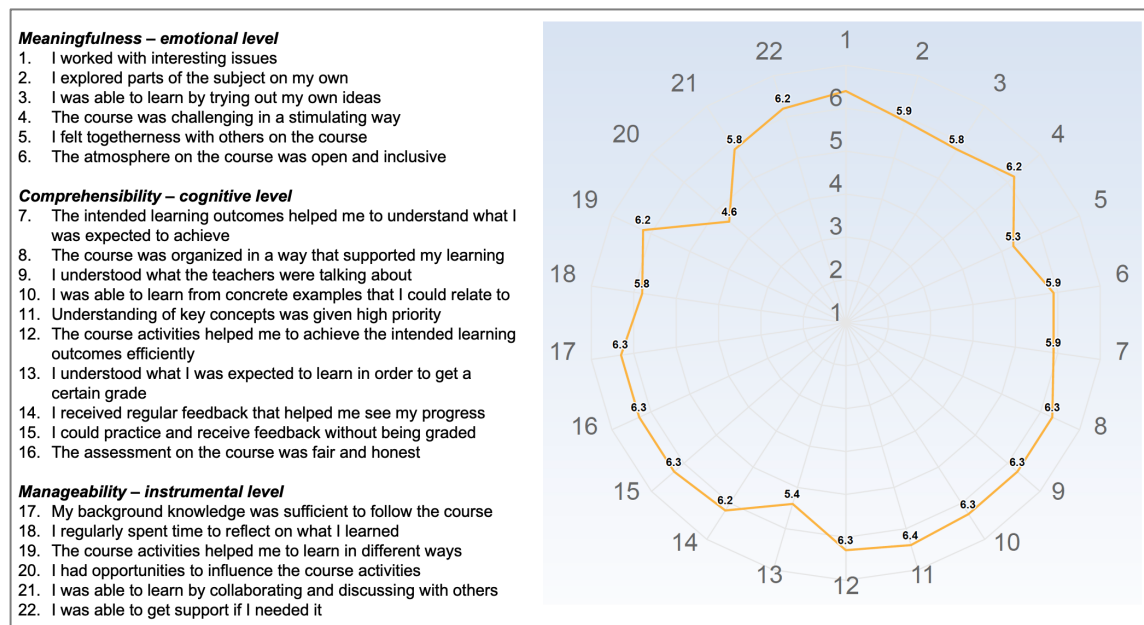

Figure 4. LEQ spider for 2023 based on disability. The results are very similar to Fig. 2.

To conclude, the results are very reassuring since I consider it to be of utmost importance that the course meets the needs for as many students as possible, regardless of disability or country of origin.

Course analysis

- *I really feel that I learnt a lot of new concepts in this course and also to use the software KiNG. I'm sure that the knowledge on predicting reliable protein models will be very useful in the future for me. So, thank you very much for this course, I really enjoyed it!*
- *Christina Divne is a blessing and it is inspiring to see professors like her and i hope to be similarly invested in my field later in life*

Based on the students' suggestions of what can be further improved there are a few things that stand out as particularly important. First, the number of students had increased from 80 in 2022 to 100 in 2023. Being the only teacher in the course made it difficult for me to provide as much support and feedback as I would like to. Although the LEQ shows that the vast majority of the students were still receiving the support they needed (question 22 was one of the highest scorings with 6.8 of 7.0), it is important that the small number of students that felt they did not get enough support are listened to. I will discuss with the program director to see if there is a possibility to have additional help in the course round 2024.

Another issue related to the large increase in number of students is the access to stationary computers in RB33. Each exercise is already given four times to make sure that there is no crowding in the computer room, however, the system where students can sign up for the preferred session does not seem to work since there are some sessions that are overbooked and others with almost no students. The booking system needs to be improved somehow, and I will think of possible solutions.

Although the project instructions were improved for the 2023 round, there are still some students that wish to have further improvement of the instructions. I will investigate this and make necessary revisions.

As in the LEQ 2022, a few students prefer the PyMOL software over KiNG and want more of the computer exercises to be performed in PyMOL. For most students, PyMOL is a more difficult software to use and a lot more time would be needed to help these students. Furthermore, PyMOL is a quite licensed software which KTH would need to buy and install on the stationary computers, which is not within my power to decide. KiNG is free for everyone and is also specifically developed for education. I will consider to maybe reformat one of the exercises to use PyMOL instead of KiNG.
