

# Course Analysis DD2414

## Fall 2023

### DD2414 Engineering project in Robotics, Perception and Learning 15.0 credits

#### Course analysis carried out by (name, e-mail):

Patric Jensfelt, [patric@kth.se](mailto:patric@kth.se)

This course round had three students participate. They worked on two projects. Both these projects were defined at RPL, one on perception for autonomous driving (2 students) and on volumetric semantic mapping (1 student). Both projects defined in collaboration between the supervisors and the students, i.e., a mix between top-down and bottom-up.

Based on discussion with the involved parties my impression is that all parties (supervisors and students) were happy with the learning experience offered by the course.

The quality of the work performed was high.

Given the individual nature of the course every project gives a different experience.

I try to update the Canvas page with more information as questions come.
