

We started by an introduction on how to conduct scientific work and how to document it using a scientific article/report format. Student worked in groups of 4, either by establishing your own group or being assigned to one. Groups were assigned problems in various scientific areas defined by a company or a research team (machine learning, natural language processing, robotics), implement a scientific method, (re)create the experiment and summarize the conducted work in a research report.

This year we worked with companies such as Doctor24, Universes, Canucci, SAS, SEB, H&M and thus defined some of the projects in collaboration with them.

Each group was be assigned a supervisor that will overview the work and act as an expert in the field.

This year we have had more examples from companies and students needed to work more closely with the opposing group. We also introduced the halv-time evaluation and consultancy hours.

Only one student did not fullfill the course requirement.
