Zhongtian Li
Student rep

Success rate a course finish: 100% (a few re-exams during the regular course time).

Student input: In general good course with good connection to work life.

More solved examples would be good. Especially home exam q4 and q5 takes time since students have very few examples of similar questions.

Failure models: Detailing failure models would be good, especially Weibull. Tommie's guest lecture is good and clarifies this a good deal, but maybe more is needed.

Markov is tricky. Examples are good but understanding could be increased.

Teacher note: Markov is a continuous struggle, some get insight into how strong tool it can be others struggle with the concepts. Multiple approaches have been tried previously and it is a challenge to get all onboard in a time efficient way.

The video lectures are good.

Regular exercises is a good complement to video lectures.

Teacher note: Good to emphasis the need to watch video lectures. This was a change for this year and it had a very positive impact on performance.
