COURSE DESIGN

Briefly describe the course design (learning activities, examinations) and any changes that have been implemented since the last course offering.

This course s given annually at KTH since 2000. The course has 12 2-hour lectures and 6 1-hour exercises The examination is based on the 5 homework assignments (1.5 points, grade scale A, B, C, D, E, FX, F), the midterm exam (1.5 points, grade scale A, B, C, D, E, FX, F), and the final exam (4.0 points, grade scale A, B, C, D, E, FX, F). During the last two years, we also offer students to do a non-obligatory group project (groups of max 2 people), intended to help them understanding a specific topic in more depth. Last year 5 groups of students has submitted their projects and 4 of these groups got bonus points for successful projects.

THE STUDENTS' WORKLOAD

Does the students' workload correspond to the expected level (40 hours/1.5 credits)? If these is a significant deviation from the expected, what can be the reason?

The student's estimated workload seems to match the expected level.

THE STUDENTS' RESULTS

How well have the students succeeded on the course? If there are significant differences compared to previous course offerings, what can be the reason?

The results a close to a normal distribution with the mean being around the grade B. This is not surprising, given that this course is selective and only students motivated to study this subject are attending it.

OVERALL IMPRESSION

Summarize the teachers' overall impressions of the course offering in relation to students' results and their evaluation of the course, as well as in relation to the changes implemented since last course offering.

The overall impression in very positive. Practically all students found the course interesting, as demonstrated by 50% of students giving the score 7 (Yes, I strongly agree with the statement) to the question 1 (I worked with interesting issues) with the average being 6.2. The students evaluated the course as challenging in a stimulating way (question 4) with the average score of 6.1.

The students confirmed that they could practice and receive feedback without being graded (question 15) with the average score of 5.3.

The students considered the assessment of the course to be fair and honest (question 16) with the average score of 6.7.

The students answered that they were able to learn by collaborating and discussing with others (question 21) with the average score of 6.1.

The students answered that they were able to get support if I needed it (question 22) with the average score of 6.0.

There seems to be no significant differences between different groups of students, except that the Swedish students gave a lower average grade 2.3 for the question 15 (I could practice and receive feedback without being graded). International students gave a higher grade 6.4 for the same question.

ANALYSIS

Is it possible to identify stronger and weaker areas in the learning environment based on the information you have gathered during the evaluation and analysis process? What can the reason for these be? Are there significant difference in experience between:
- students identifying as female and male?
- international and national students?

- students with or without disabilities?

The highest average score 6.7 for the question 16 (The assessment on the course was fair and honest) and the next highest is 6.2 for the question 1 (I worked with interesting issues). This shows that the course is well-organised and carried out.

The lowest average score is 5.3 for the question 15 (I could practice and receive feedback without being graded). It might be correlated to the fact that the assessment of this course is very well defined and that may look limiting to some students.

PRIORITIZED COURSE DEVELOPMENT
What aspects of the course should be developed primaily? How can these aspects be developed in short and long term?
In the short term, we will continue offering non-compulsory group projects, as we did during the last two years. In the long term, we will keep updating the course material with the new developments in the area of fault-tolerant design.
