

Course analysis

SK2513 Cell culture: theory and practice

2019

In autumn 2019, seven students were registered on the course (ten was the maximal possible number of participants), all of them participated in the course activities.

All students participated in the final exam, with the following results:

A – 5 students

B – 1 student

C – 1 student

The lectures went according to the plan, as well as the labs.

The course evaluation was unfortunately not performed, but I got very positive feedback from several students. They were especially satisfied with the course labs, where they got to work with living cells. For several students this was their first lab experience ever.

We had an elected student representative who could convey to the teacher any issue that might have arisen during or after the course. However, no issues were raised by the students.

The next course offering will be moved from study period 2 to study period 3, in order to fit better into the Engineering Physics (track Biomedicine) master program activities.

No major changes are planned for the next course offering.
